VI Systems of Differential Equations	1
Addendum to Chapter 35: Higher-Order Systems	35–1
35.7 Higher-Order Systems	35–1
Additional Exercises	35–4
36 Critical Points, Direction Fields and Trajectories—ALT	36–1
36.1 Important Terminology and Convenient Notation	36–1
36.2 Constant (or Equilibrium) Solutions	36–5
36.3 Sketching Trajectories for Autonomous Systems	36–10
36.4 Critical Points, Stability and Long-Term Behavior	36–14
36.5 Applications	36–17
36.6 Existence and Uniqueness of Trajectories	36–24
36.7 Proving Theorem 36.2	36–25
Additional Exercises	36–29
37 Homogeneous Linear Systems and Their General Solutions	37–1
37.1 Basic Terminology and Notation	37–1
37.2 More Terminology and Some Basic Results	37–4
37.3 The Main Result on General Solutions to Linear Systems	37–12
37.4 Wronskians and Identifying Fundamental Sets	37–12
37.5 Fundamental Matrices	37–17
37.6 General Solutions for a Single N^{th} -order Linear Differential Equation	37–17
Additional Exercises	37–21
38 Homogeneous Constant Matrix Systems, Part I	38–1
38.1 Basics and Some Fundamental Solutions	38–1
38.2 A Short Review of Eigenvalues and Eigenvectors (with Applications)	38–3
38.3 Eigenpairs and Corresponding Solutions	38–13
38.4 Two-Dimensional Phase Portraits: Preliminaries	38–14
38.5 Two-Dimensional Phase Portraits from Real, Complete Eigen-Sets	38–16
Additional Exercises	38–24
39 Homogeneous Constant Matrix Systems, Part II	39–1
39.1 Solutions Corresponding to Complex Eigenvalues	39–1
39.2 Two-Dimensional Phase Portraits with Complex Eigenvalues	39–6
39.3 ‘Second Solutions’ When the Set of Eigenvectors is Incomplete	39–11

39.4 Two-Dimensional Phase Portraits with Incomplete Sets of Eigenvectors	39–14
39.5 Complete Sets of Solutions Corresponding to Incomplete Sets of Eigenvectors . . .	39–17
39.6 Appendix for Sections 39.1 and 39.2	39–24
Additional Exercises	39–28
40 Miscellaneous Topics Involving Homogeneous Constant Matrix Systems	40–1
40.1 Shifted Constant Matrix Systems	40–1
40.2 Classifying Critical Points for 2×2 Systems	40–3
40.3 Phase Portraits for Imprecisely Known Systems	40–4
40.4 Phase Portraits for Large Constant Matrix Systems	40–6
40.5 Using Fundamental and Exponential Matrices	40–7
40.6 Using Laplace Transforms	40–16
40.7 Euler Systems	40–16
40.8 Using Similarity Transforms	40–21
Additional Exercises	40–25
41 Nonhomogeneous Linear Systems	41–1
41.1 General Theory	41–1
41.2 Method of Undetermined Coefficients / Educated Guess	41–3
41.3 Reduction of Order/Variation of Parameters	41–9
41.4 Using Laplace Transforms	41–16
41.5 Using Similarity Transforms	41–17
Additional Exercises	41–20
42 Nonlinear Systems: Phase Plane Analysis Using Linearizations	42–1
42.1 The Systems of Interest and a Little Review	42–1
42.2 Rewriting Systems Using Jacobian Matrices	42–3
42.3 Linearized Systems and Trajectories Near Critical Points	42–8
42.4 Sketching Trajectories for Nonlinear Systems	42–12
42.5 Application: Competing Species	42–15
42.6 Re-Analyzing a Particular Competing Species Model	42–15
42.7 General Analysis of the Competing Species Model	42–21
42.8 Application: The Damped Pendulum	42–25
Additional Exercises	42–29
43 Coordinate Curves for Trajectories	43–1
43.1 Coordinate Equations for Trajectories	43–1
43.2 Trajectories as Level Curves	43–3
43.3 Application: Foxes in the Rabbit Ranch	43–5
43.4 Application: The Ideal Pendulum	43–10
Additional Exercises	43–13
44 The Liapunov Method for Determining Stability (DRAFT)	44–1
44.1 The Liapunov Method, Naively Developed	44–1
44.2 The Liapunov Theory: Rigorous Definitions and Results	44–7
44.3 Finding Liapunov Functions	44–10
44.4 Appendix – Technical Issues	44–13
Additional Exercises	44–13
