To the Reader	xiii
I The Basics	1
1 The Starting Point: Basic Concepts and Terminology	3
1.1 Differential Equations: Basic Definitions and Classifications	3
Solutions: The Basic Notions	5
Initial-Value Problems	7
1.2 Why Care About Differential Equations? Some Illustrative Examples	8
The Situation to Be Modeled:	9
The Simplest Falling Object Model	10
A Better Falling Object Model	12
Summary of Our Models and the Related Initial Value Problems	14
1.3 More on Solutions	15
Intervals of Interest	15
Solutions Over Intervals	16
Describing Particular Solutions	17
Exercises	18
2 Integration and Differential Equations	23
2.1 Directly-Integrable Equations	23
2.2 On Using Indefinite Integrals	25
2.3 On Using Definite Integrals	26
Basic Ideas	26
Advantages of Using Definite Integrals	28
Important "Named" Definite Integrals with Variable Limits	29
2.4 Integrals of Piecewise-Defined Functions	31
Computing the Integrals	31
Continuity of the Integrals	34
Exercises	37
II First-Order Equations	41
3 Some Basics about First-Order Equations	43
3.1 Algebraically Solving for the Derivative	43

3.2	Constant (or Equilibrium) Solutions	45
3.3	On the Existence and Uniqueness of Solutions	48
3.4	Confirming the Existence of Solutions (Core Ideas)	50
	Converting to an Integral Equation	50
	Generating a Sequence of “Approximate Solutions”	51
	(Naively) Taking the Limit	52
3.5	Details in the Proofs of Theorem 3.1	53
	Confirming the Existence of Solutions	53
	The Uniqueness Claim in Theorem 3.1	63
3.6	On Proving Theorem 3.2	64
3.7	Appendix: A Little Multivariable Calculus	66
	Functions of Two Variables	66
	Functions of More than Two Variables	69
	Exercises	70
4	Separable First-Order Equations	73
4.1	Basic Notions	73
	Separability	73
	Integrating Separable Equations	75
4.2	Constant Solutions	78
	Avoiding Division by Zero	78
	The Importance of Constant Solutions	81
4.3	Explicit Versus Implicit Solutions	83
4.4	The Full Procedure for Solving Separable Equations	86
4.5	Existence, Uniqueness, and False Solutions	86
	On the Existence and Uniqueness of Solutions	86
	A Caution on False Solutions	88
4.6	On the Nature of Solutions to Differential Equations	90
4.7	Using and Graphing Implicit Solutions	92
4.8	On Using Definite Integrals with Separable Equations	97
	Exercises	99
5	Linear First-Order Equations	103
5.1	Basic Notions	103
	Definitions	103
	Deriving the Trick for Solving	105
5.2	Solving First-Order Linear Equations	106
5.3	On Using Definite Integrals with Linear Equations	110
5.4	Integrability and the Existence and Uniqueness of Solutions	113
	Exercises	114
6	Simplifying Through Substitution	117
6.1	Basic Notions	117
6.2	Linear Substitutions	119
6.3	Homogeneous Equations	122
6.4	Bernoulli Equations	125
	Exercises	126

7	The Exact Form and General Integrating Factors	129
7.1	The Chain Rule	129
7.2	The Exact Form, Defined	131
7.3	Solving Equations in Exact Form	134
	Using a Known Potential Function	134
	Finding the Potential Function	136
7.4	Testing for Exactness — Part I	140
7.5	Exact Equations: A Summary	142
7.6	Converting Equations to Exact Form	143
	Basic Notions	143
	Finding Integrating Factors	144
7.7	Testing for Exactness — Part II	150
	Simple Connectivity and the Complete Test for Exactness	150
	Proving Theorem 7.4	154
	Exercises	154
8	Slope Fields: Graphing Solutions Without the Solutions	157
8.1	Motivation and Basic Concepts	157
8.2	The Basic Procedure	159
8.3	Observing Long-Term Behavior in Slope Fields	164
	Basic Notions	164
	Constant Solutions and Stability	166
8.4	Problem Points in Slope Fields, and Issues of Existence and Uniqueness	170
	Infinite Slopes	171
	Undefined and Indeterminant Slopes	173
	Curves Diverging From or Converging To a Point	174
	On Existence and Uniqueness	175
8.5	Tests for Stability	177
	Autonomous Equations	178
	Nonautonomous Equations	185
	Exercises	186
9	Euler's Numerical Method	191
9.1	Deriving the Steps of the Method	191
	The Basic Step Approximation	192
	Generating the Numerical Solution (Generalities)	193
9.2	Computing Via Euler's Method (Illustrated)	193
	The Steps in Euler's Method	193
	Using the Results of the Method	196
	On Doing the Computations	196
9.3	What Can Go Wrong	197
9.4	Reducing the Error	199
	Smaller Step Sizes	199
	Better Methods	201
9.5	Error Analysis for Euler's Method	202
	The Problem and Assumptions	202
	Preliminary Bounds	203
	Maximum Error in the Underlying Approximation	204

Ideal Maximum Error in Euler's Method	205
Exercises	208
10 The Art and Science of Modeling with First-Order Equations	211
10.1 Preliminaries	212
10.2 A Rabbit Ranch	213
The Situation to be Modeled	213
Setting Up the Model	213
Using Our Model	215
10.3 Exponential Growth and Decay	215
Simple Population Models	216
Natural Radioactive Decay	217
10.4 The Rabbit Ranch, Again	218
The Situation (and Problem)	218
A Better Model	219
Using the Better Model	221
10.5 Notes on the Art and Science of Modeling	222
First Steps in the Modeling Process	222
Developing the Differential Equation for the Model	223
Testing and Using the Model	226
10.6 Mixing Problems	226
A Simple Mixing Problem	227
Other Mixing Problems	230
10.7 Simple Thermodynamics	230
10.8 Appendix: Approximations That Are Not Approximations	231
Exercises	233
 III Second- and Higher-Order Differential Equations	 239
11 Higher-Order Equations: Extending First-Order Concepts	241
11.1 Treating Some Second-Order Equations as First-Order	242
Solving Second-Order Differential Equations Not Explicitly Containing y	242
Equations of Even Higher Orders	245
Converting a Differential Equations to a System	245
11.2 The Other Class of Second-Order Equations "Easily Reduced" to First-Order	247
Solving Second-Order Autonomous Equations	247
A Few Comments	249
11.3 Initial-Value Problems	250
Initial Values with Higher-Order Equations	250
Solving Higher-Order Initial-Value Problems	250
11.4 On the Existence and Uniqueness of Solutions	253
Second-Order Problems	253
Problems of Any Order	254
Exercises	255
 12 Higher-Order Linear Equations: Introduction and Basic Theory	 259
12.1 Basic Terminology	259

12.2 Basic Useful Theory about ‘Linearity’	262
The Operator Associated with a Linear Differential Equation	262
The Principle of Superposition	265
Linear Independence	267
12.3 Fundamental Sets of Solutions and Some Suspicions	269
12.4 “Multiplying” and “Factoring” Operators	271
The Composition Product	271
Factoring	275
Exercises	277
13 Reduction of Order	283
13.1 The General Idea	283
13.2 Reduction of Order for Homogeneous Linear Second-Order Equations	284
The Method	284
An Observation About the Solution	288
13.3 Reduction of Order for Nonhomogeneous Linear Second-Order Equations	289
13.4 Reduction of Order in General	292
Exercises	294
14 Homogeneous Linear Equations — The Big Theorems	297
14.1 Preliminaries and a Little Review	297
14.2 Second-Order Homogeneous Equations	298
The Form of the Reduction of Order Solution	298
Applying a Little Linear Algebra	300
14.3 Homogeneous Linear Equations of Arbitrary Order	303
14.4 Linear Independence and Wronskians	304
Exercises	307
15 Homogeneous Linear Equations — Verifying the Big Theorems	311
15.1 First-Order Equations	311
15.2 The Second-Order Case	314
The Equation and Basic Assumptions	314
Basic Existence and Uniqueness	314
What Wronskians Tell Us	316
The Big Theorem on Second-Order Homogeneous Linear Differential Equations	321
15.3 Arbitrary Homogeneous Linear Equations	323
The Differential Equation and Basic Assumptions	323
Basic Existence and Uniqueness	323
A “Matrix/Vector” Formula for Linear Combinations	324
Initial-Value Problems	325
Expressing All Solutions as Linear Combinations	327
Existence of Fundamental Sets	329
A Little More Linear Algebra	331
Summary and Final Results	332
Exercises	334
16 Second-Order Homogeneous Linear Equations with Constant Coefficients	337
16.1 Deriving the Basic Approach	337

Seeking Inspiration	337
Exponential Solutions with Second-Order Equations	338
16.2 The Basic Approach, Summarized	340
16.3 Case 1: Two Distinct Real Roots	342
16.4 Case 2: Only One Root	343
Using Reduction of Order	343
Skipping Reduction of Order	346
16.5 Case 3: Complex Roots	347
Blindly Using Complex Roots	347
The Complex Exponential Function	349
Intelligently Using Complex Roots	351
16.6 Summary	354
Exercises	355
17 Springs: Part I	357
17.1 Modeling the Action	357
The Mass/Spring System	357
Modeling the Forces	358
A Note on Units	360
17.2 The Mass/Spring Equation and Its Solutions	361
The Differential Equation	361
Undamped Systems	362
Damped Systems	366
Exercises	371
18 Arbitrary Homogeneous Linear Equations with Constant Coefficients	375
18.1 Some Algebra	375
18.2 Solving the Differential Equation	378
The Characteristic Equation	378
Particular Solutions Corresponding to One Root	379
18.3 Some More Examples	382
18.4 On Verifying Theorem 18.2	385
Linear Differential Operators with Constant Coefficients	385
Proof of Theorem 18.2	388
18.5 On Verifying Theorem 18.3	391
Exercises	393
19 Euler Equations	395
19.1 Second-Order Euler Equations	395
Basics	395
The Steps in Solving Second-Order Euler Equations	397
19.2 The Special Cases	399
A Single Value for r	399
Complex Values for r	400
19.3 Euler Equations of Any Order	403
19.4 The Relation Between Euler and Constant Coefficient Equations	405
Exercises	407

20 Nonhomogeneous Equations in General	409
20.1 Basic Theory	409
Recollections about Linearity	409
General Solutions to Nonhomogeneous Equations	410
20.2 Superposition for Nonhomogeneous Equations	413
20.3 Reduction of Order	416
Exercises	416
21 Method of Undetermined Coefficients (aka: Method of Educated Guess)	421
21.1 Basic Ideas	421
21.2 Good First Guesses For Various Choices of g	424
Exponentials	424
Sines and Cosines	424
Polynomials	426
Products of Exponentials, Polynomials, and Sines and Cosines	427
21.3 When the First Guess Fails	428
21.4 Method of Guess in General	430
21.5 Common Mistakes	433
A Bad Alternative to Formula (21.3)	433
Using Too Many Undetermined Coefficients	434
21.6 Using the Principle of Superposition	435
21.7 On Verifying Theorem 21.1	436
A Useful Lemma	436
Proving the Main Theorem	438
Exercises	438
22 Springs: Part II	441
22.1 The Mass/Spring System	441
22.2 Constant Force	443
22.3 Resonance and Sinusoidal Forces	444
Sinusoidal Force in Undamped Systems	445
Sinusoidal Force in Damped Systems	448
22.4 More on Undamped Motion Under Nonresonant Sinusoidal Forces	450
Exercises	453
23 Variation of Parameters (A Better Reduction of Order Method for Nonhomogeneous Equations)	457
23.1 Second-Order Variation of Parameters	457
Derivation of the Method	457
Summary: How to Do It	463
Possible Difficulties	465
23.2 Variation of Parameters for Even Higher Order Equations	466
23.3 The Variation of Parameters Formula	468
Second-Order Version with Indefinite Integrals	468
Second-Order Version with Definite Integrals	469
For Arbitrary Orders	470
Exercises	471

IV The Laplace Transform	473
24 The Laplace Transform (Intro)	475
24.1 Basic Definition and Examples	475
Definition, Notation and Other Basics	475
Transforms of Some Common Functions	477
24.2 Linearity and Some More Basic Transforms	481
24.3 Tables and a Few More Transforms	483
Arbitrary Powers (and the Gamma Function)	484
The Shifted Unit Step Function	487
24.4 The First Translation Identity (And More Transforms)	488
24.5 What Is “Laplace Transformable”?	
(and Some Standard Terminology)	491
Jump Discontinuities and Piecewise Continuity	491
Exponential Order	494
Transforms of Piecewise Continuous Functions of Exponential Order	494
24.6 Further Notes on Piecewise Continuous and Exponentially Bounded Functions	496
Issues Regarding Piecewise Continuous Functions on $(0, \infty)$	496
Testing for Exponential Order	498
Proving Theorem 24.5	499
The Proof of Theorem 24.5	500
Exercises	502
25 Differentiation and the Laplace Transform	507
25.1 Transforms of Derivatives	507
The Main Identity	507
Using the Main Identity	509
25.2 Derivatives of Transforms	512
25.3 Transforms of Integrals and Integrals of Transforms	514
Transform of an Integral	515
Integral of a Transform	517
Addendum	518
25.4 Appendix: Differentiating the Transform	519
The Main Issue	519
The Rigorous Derivation	521
Exercises	523
26 The Inverse Laplace Transform	527
26.1 Basic Notions	527
On Recovering a Function from Its Transform	527
The Inverse Laplace Transform Defined	528
26.2 Linearity and Using Partial Fractions	530
Linearity of the Inverse Transform	530
Partial Fractions	531
26.3 Inverse Transforms of Shifted Functions	535
Exercises	537

27 Convolution	539
27.1 Convolution, the Basics	539
Definition and Notation	539
Basic Identities	541
Observations on the Existence of the Convolution	543
27.2 Convolution and Products of Transforms	543
27.3 Convolution and Differential Equations (Duhamel's Principle)	548
Exercises	552
28 Piecewise-Defined Functions and Periodic Functions	555
28.1 Piecewise-Defined Functions	555
Piecewise-Defined Functions, Defined	555
Step Functions, Again	556
28.2 The "Translation Along the T -Axis" Identity	558
The Identity	558
Computing Inverse Transforms	559
Computing Transforms with the Identity	562
28.3 Rectangle Functions and Transforms of More Complicated Piecewise-Defined Functions	563
Rectangle Functions	563
Transforming More General Piecewise-Defined Functions	565
28.4 Convolution with Piecewise-Defined Functions	568
28.5 Periodic Functions	571
Basics	571
Transforms of Periodic Functions	572
Addendum: Verifying Equation (28.15)	576
28.6 An Expanded Table of Identities	577
28.7 Duhamel's Principle and Resonance	578
The Problem	578
Solutions Using Arbitrary f	578
Resonance from Periodic Forcing Functions	581
Exercises	585
29 Delta Functions	589
29.1 Visualizing Delta Functions	589
29.2 Delta Functions in Modeling	590
Strong Forces of Brief Duration	591
As Density Functions for Point Masses	593
29.3 The Mathematics of Delta Functions	594
Integrals with Delta Functions	594
Laplace Transforms of Delta Functions	596
Differential Equations with Delta functions	597
29.4 Delta Functions and Duhamel's Principle	599
29.5 Some "Issues" with Delta Functions	601
Defining the Delta Functions	601
Continuity of Solutions and Problems with Initial Values	603
Exercises	604

Appendices	607
A Guide to Using This Text	609
Answers to Selected Exercises	615
